1 DESCRIPTION OF ARTWORK

“[sin-gí] : Data Weaving” connects digital language and cultural language, developing sound waves of real-time visual programming. It transcodes sound data of local narratives into woven visual patterns, becoming a touchable textile embedded with body artistries and generating local narratives in cross-cultural sound preservations of digital materials. The textiles of “[sin-gí] : Data Weaving” are stored, arranged, and indexed individual messages in a meaning materialized way, and become a trace of the producers’ body marks, as well as a way of interaction in which personal language is memorized and cultural textiles are mutually mended.

The message can be used as coding contents of textiles, and the textiles can also be used as the interface of the message output. “Data Weaving” translates three ethnic groups’ language from **Makatao**, **Tevorangh**, and **Siraya** and the phonetic system of Taiwan Heluo accent into binary codes and uses the ancient “Macramé” weaving technique to create a weaving with cross-ethnic coexistence of multilingual and multimodal groups. Embroidery and textiles not only serve as a worldwide cultural-materialized symbol, but the physical act of “sewing” is also a process of mutual understanding and body empathy of multiple subjects. The production of textiles is a physical behavior of weaving visible and material data, and the action of participating in the weaving of objects is not only the perceptual action of the subject facing the material but also constructs the meaning of cultural technology: a trace of body, time, material and cultural environment that is embedded in textiles in a material and visual way. Textiles show us a collection of data language through patterns, body movements, and circular behavior. With the updated aggregation of technical information and pattern visualization, a textile transmits not only the visual data on the surface of the textile, but also accumulates the material meaning of the “cultural mending” relationship between people, cultural materials, and living environment, forming a circular culture and intercultural dialogue. In addition to transcoding the cultural data, the work is also combined with the acoustic pronunciation device

of a digital version of Theremin to become an instantly interactive and magnetic wave-sensitive acoustic textile.
